

Moving Prospector to a New Computer

Setting up a new computer with Prospector is easier than ever with the Migrate feature:

Tools / Migrate Feature

Migrate / Export.... lets you save all your current settings for Prospector to a Prospector Migration File (*.pmf). The migration file has in it:

- The configurable post processors you use.
 - Custom post processors you use.
 - Output folders needed for post processed files.
 - Any Visual Basic scripting macros you use.
 - Your PowerSource User and System databases.
 - Toolbars, user interface customizations, ... (i.e. all the data from Tools / Export Settings...)
1. On the 'old' computer (the one you are currently running Prospector), choose Tools / Migrate / Export... and create your migration file.
 2. On the new computer you are setting up to run Prospector, install the Prospector software.
 3. Copy your migration file from the old computer to the new one.
 4. Start Prospector and choose Tools / Migrate / Import... and browse the migration file.

Bingo! You're all set. The new computer now has exactly the same configuration for Prospector as the old one.

Here's a tip: Use the Migrate/Export to save your settings. Save the file to a secure location where you can retrieve it in the event your computer and/or disk drive has a catastrophic crash. After repairs or you get a new computer, you can quickly restore Prospector to how it was prior to the crash.
